A decorative graphic on the left side of the slide, consisting of a blue sphere with a white sine wave pattern on its surface, set against a background of horizontal lines that fade out to the right.

# ***Pulse calibration***

# RF-routing for triple resonance, 2H-dec.

The screenshot shows the edasp software interface with a table of channel parameters and a routing diagram. The table lists four channels (NUC 1-4) with their respective frequencies and logical channel names. The routing diagram shows the connections between these channels and various amplifiers and preamplifiers. A parameter window for XWIN-NMR is open, showing the FCUCHAN parameter set to 2 1 3 4 0 0 0 0, which is circled in yellow. A red arrow points to the 'PARAM' button, and a yellow arrow points to the 'Seen' button in the parameter window.

| frequency            | logical channel | amplifier | preamplifier |
|----------------------|-----------------|-----------|--------------|
| BF1 500.1230000 MHz  | NUC 1           |           |              |
| SFO1 500.1253558 MHz | F1              | FCU1      | 1H LNA       |
| OFSH1 2355.800 Hz    | 1H              |           | XBB19F 2HS   |

## getprosol without options:

- loads parameters for pulses according to prosol-tables created with 'edprosol'
- prosol-tables are global, any changes will apply to all users and data set

## getprosol <nuc> <P90> <PL90>

- recalculate power levels of the prosol-table for all pulses of selected nucleus
- standard prosol-tables are NOT modified
- changes act on current data set only

## Example:

- Hard  $^1\text{H}$ -pulse had been re-calibrated:
  - $90^\circ = 9.7\mu\text{s}$  @  $\text{p11} = 2.3\text{dB}$
- $^1\text{H}$ -pulse differs from value stored in prosol-table, which is:
  - $90^\circ = 7.2\mu\text{s}$  @  $\text{p11} = 1.8\text{dB}$
- Recalculate all power levels for all pulses stored in the prosol-table of  $^1\text{H}$ :  
enter:        `getprosol 1H 9.7us 2.3dB`
- Now all  $^1\text{H}$  pulses have been recalculated and set in the current dataset

## pulse

- calculate power level, pulse duration or excitation bandwidth
- calculations are based on transmitter pulse P1 and PL1
- examples:
  - pulse 25us : power level and bandwidth for 25us pulse
  - pulse 12.3khz : power level and duration for a pulse with a bandwidth of  $\gamma B_1 = 12.3\text{kHz}$
  - pulse 5.3db : pulse duration and bandwidth for a pulse applied with 5.3 dB RF power

## calcpowlev

- calculate power for a new pulse, related to reference pulse

# Before you start....

4. <sup>1</sup>H trim pulses

## ***<sup>1</sup>H pulses:***

***- shortest pulse allowed for non-lossy samples:***

***8usec (max. 360°)***

***- hard pulse for lossy samples:***

***power level corresp. to 8usec for non-lossy sample:***

***- trim pulse 'P28':***

***2ms @ 10usec <sup>1)</sup>***

***- TOCSY spin lock:***

***200ms @ 25usec <sup>1)</sup>, 400ms @ 35usec <sup>1)</sup>***

***- ROESY, Waltz16-decoupling:***

***up to CW @ 100usec <sup>1)</sup>***

<sup>1)</sup> power and pulse of non-lossy sample

## **<sup>13</sup>C pulses:**

### **- shortest pulse allowed:**

**15usec** (max. 360°)

### **- trim pulses:**

**2ms @ 25usec**

### **- CC spin lock:**

**20ms @ 25usec**

### **- GARP decoupling:**

**140ms @ 65usec (500MHz) / 55usec (600-800MHz)**

### **- selective pulses:**

---

**500-600 MHz: Q5: 320usec**

**Q3: 256usec**

**700-800 MHz: G4: 308usec**

**Q3: 210usec**

## ***<sup>15</sup>N pulses:***

### ***- shortest pulse allowed:***

***40usec (max. 360°)***

### ***- WALTZ16 decoupling:***

***140ms @ 200usec (500MHz) / 170usec (600-800MHz)***

### ***- simultaneous <sup>13</sup>C, <sup>15</sup>N pulses:***

***attenuate power by 3dB on BOTH, <sup>13</sup>C and <sup>15</sup>N channel***

---

## **Z-gradient:**

**- absolute max. current:**

**10A**

**- max. overall length:**

**10ms @ 10A**
